The present sequence is a human OCTIP (organic cation transporter-like protein), a member of the superfamily of sugar and other transporter molecules that have 12 transmembrane domains.

The sequence is derived from a human foetal brain cDNA library. The protein is highly expressed in brain tissue and has nootropic, neuroperotective, neuroleptic, anticonvulsant, antiParkinsonian, antidepressant activities. The present sequence is used to regulate a variety of cellular processes e.g. cell proliferation, differentiation and survival, screen OCTIP modulators and detect mutation in OCTIP gene. OCTIP modulators can be used to treat or prevent chronic neurodegenerative disorders (e.g. Alzheimer's, Parkinson's, depression), behavioural, sleep and eating disorders.
                                                                                                                                                                                                                                                                                                                             QVALLTSVVFVGMMSSSTLWGNISDQYGRKTGLKISVLWTLYYGILSAFAPVYSW1LVI.R 180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing particularly L-18sine. The present sequence is a protein described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the
                                                                                                                                                                                                                                                                                                                                                                                                                       Novel polynucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analysing expression profile or pattern of a gene and identifying homologous gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence; corn.

This sequence represents a secreted human protein encoded by the gene clone detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoylobulin FC protein as compared to the numan protein only.

Protein as compared to the human protein only.

The invention relates to 95 movel genes and their frayments (nucleic acid sequences: AAZ24811-Z24907; amino acid sequences AAX441088 Y41404) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypoeptides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 95 polyportides, based on which tissues they are most highly expressed in
                                                                                                                                                         New isolated human genes, useful for diagnosis and treatment of e.g. cancers, neurological disorders, immune diseases, inflammation or blood disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Goquet de la Salmoniere Y;

                                                                                                                                                                                                                                      proteins from various Mycobacterium species microorganisms. The encoding nucleotide sequences can be used as primers and probes for methods for detecting and identifying mycobacteria, especially belonging to the M. tuberculosis complex. The encoded proteins can be used in vaccines for immunisation against a bacterial or viral infection.

AAH55090 represent specifically claimed S. epidermidis genomic DNA polynucleotide sequences from the present invention. AAH55091 to AAH55098 represent oligonucleotide sequences and primers which are used in the exemplification of the present invention.

N.B. The present invention specifically claims all the polynucleotide sequences given in the sequence listing of the present specification, however the sequence listing only goes up to SKO ID NO:4454 so even though sequences are given in the disclosure for SEO ID NO:4465 to 4472, no sequences are present for SEO ID NO:4455 to 4472,

                                                                                                                                             Sequences AAV04742-Y05000 and AAV07201-Y07204 represent secreted proteins from various Mycobacterium species microorganisms. The encoding nucleotide sequences can be used as primers and probes for methods for detecting and identifying mycobacteria, especially belonging to the M. tuberculosis complex. The encoded proteins can be used in vaccines for immunisation against a bacterial or viral infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAH52304 to AAH53970 represent nucleic acids (I) encoding polypeptides (II), given in AAG81454 to AAG83120, from Staphylococcus epidermidis. (II) and (II) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the S. epidermidis polypeptides (II) via the production of vectors polypeptides (II) via the production of vectors polypeptides (II) via the production and vice acids) may then be polypeptides (II) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their activity and therefore identify compounds that may be used for the treatment of S. epidermidis infections, e.g. endocarditis. AAG7349-AAG73519 represent human secreted protein fragments. The genes and their corresponding secreted proteins are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Pathological conditions can be diagnosed by determining the

cc amount of the new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 25 genes, based on the tissues in which they are most highly expressed, and include developing products for the diagnosis or treatment of proliferative disorders, cancer, tumours, foetal and developmental abnormalities, haematopoietic disorders, diseases of the immune system, altergies, neurological disorders (e.g., rheumatoid arthritis), inflammation, altergies, neurological disorders, etg., rheumatoid arthritis), inflammation, altergies, neurological disorders, schizophrenia, asthma, cc altergies, neurological disorders, sepsis, diabetes, atherosclerosis, cardiovascular disorders, prognancy-related disorders, endocrine cf skin disorders, prognancy-related disorders, endocrine disorders, and infections. The proteins can also be used to aid wound calsorders, and infections. The proteins can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to culture of primary tissues, to regenerate tissues, to identify their confinence of prinding partners, and in chemotaxis, and can be used confinence of prinding partners, and in chemotaxis, and can be used confinence as a food additive or preservative to modify storage properties.

Cc dilure of prinding partners, and in chemotaxis, and can be used confinence as a food additive or preservative to modify storage properties.

Cc as a food additive or preservative to modify storage properties.

Cc allure of prinding partners, and in chemotaxis, and can be used confinence as a food additive or preservative to modify storage properties.

Cc alleviating symptoms associated with the disorders mentioned above, and indiagnostic immunosorbent assay (ELISA). The present sequence represents a human created protein fragment referred to in the disclosure of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;;

Nucleic acid molecules encoding human secreted proteins, used in preventing, treating or ameliorating a disorder, e.g. Alzheimer's and

```
This invention relates to polynucleotide sequences AAF63789 · AAF63836

which encode human secreted proteins AAB75260 - AAB7537. Included in the invention are protein sequences AAB75288 - AAB75387. Included in the invention are protein sequences AAB75288 - AAB75387. Included in the coff invention are protein sequences AAB75288 - AAB75387. Included these creted proteins and amino acid sequences with which these fragments share homology. Examples of their agonists and antagonists and include, immunosuppressive; antiarthritic; antirheumatic; antiproliferative; cytostatic; cardiant; vasotropic; cerebroprotective; coptibulatogical; and vulnerary activity. The protein and polynucleotide coptibulation and vulnerary activity. The protein and polynucleotide sequences, their agonists and antagonists may be useful for treating, coptibulating and diagnosing diseases and disorders such as autoimmune complexed and diagnosing diseases and disorders such as autoimmune complexed arrest, cerebrovascular disorders e.g. neoplasms of the breast or liver, cardiovascular disorders considerations caused by bacterial viruses and fungi and ocular disorders considerations caused by bacterial viruses and fungi and ocular disorders consideration. The polypeptides can also be used to aid wound couldring and epithelial cell proliferation, to prevent skin aday due to subburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities. Included in the invention colligonal colligonal colligonal capabilities. Included in the invention sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ;;

A eukaryotic cell growth inhibiting factor (AAR95954) was identified as the product of cDNA clone pTB1848 (AAT30564). This clone was isolated by incorporating cDNA from aged normal human diploid fibroblast MKC-5 cells into vector pTB1589 under control of the nmtl promoter, transforming of Schizosaccharomyces pombe cells and screening for transformants showing cDNA-dependent growth inhibition. Other cDNA clones coding for eukaryotic cell growth inhibiting factors were also obtd. (see also AAR95951-57). These proteins are useful as anticancer agents and infection remedies. They can also be useful as acid synthesis in target cells. They can also be used to terminate the cell cycle of cultured cells at a given time point.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                      ANH52304 to AAH53970 represent nucleic acids (1) encoding polypeptides (11), given in AAG81454 to AAG83120, from Staphylococcus epidermidis. (1) and (11) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (1) may be used to produce the used to produce the sequence them which are used to produce hosts cells which express the polypeptides. The polypeptides (11) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their activity and therefore identify compounds that may be used for the treatment of S. epidermidis infections, e.g. endocarditis. AAH53971 to AAH5509 represent specifically claimed S. epidermidis genomic DNA polynucleotide sequences from the present invention. AAH55091 to AAH55098 represent oligonucleotide sequences and primers which are used in the present invention of the present invention.

N.B. The present invention specifically claims all the polynucleotide sequence listing of the present specification, however the sequence listing only goes up to SEQ ID NO:4455 to 4472, no sequences are given in the SEQ ID NO:4455 to 4472,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Caps
 Nucleic acids encoding polypeptides from Staphylococcus epidermidis, useful for vaccinating against infections, e.g. endocarditis -

antibodies. This vaccine overcomes the disadvantages of the chemically inactivated toxoids and is designed to protect individuals against one or several related staphylococcal and streptococcal toxins. It is used for the diagnosis and treatment or amelioration of superantiqenrassociated bacterial infections.

The coding region of the SA9 toxin when altered by site directed mutagenesis, results in disruption of binding of the toxin to both the MMC class II or T-cell antigen receptor. SEA has antibacterial and cytostatic activity. This sequence is useful for the production of SEA vaccines and specific

The invention relates to human polynucleotides (AAI63803-AAI64012) and the encoded proteins (AAM44497-AAM43660) useful for preventing, treating cr amaliorating medical conditions e.g. by protein or quee therapy. The genes were isolated from a range of human tissues disclosed in the genes were isolated from a range of human tissues disclosed in the genes were isolated from a range of human tissues disclosed in the genes were adagnosis, treatment and prevention oi: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, urogenital; (b) immune disorders e.g. Addison's disease, mellitus, cronn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial isothemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infections diseases such as viral, bacterial, fungal and parasitic infections.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.WiPo.int/Pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated nucleic acids and polypeptides, useful for diagnosing, treating and/or preventing human diseases and disorders -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 11; SEQ ID NO 303; 664pp + Sequence Listing; English.

DNA sequence coding for a protein of A. thaliana having a delta-5,7 sterol, delta-7 reductase activity, delta7-Red protein, production process, strains of transformed yeasts, uses.
         Sequence 2, Application US/08931047
Patent No. 5965417

A;Title: Characterization of spaA, a Streptomyces coelicolor gene homologous to a gen A;Reference number: JC5178; MUID:97080529
A;Accession: JC5178
A;Accession: JC5178
A;Status: preliminary
A;Molecule type: DNA
A;Residues: 1-413 <SCH>
A;CHSS-references: EMBL:X94190; NID:g1694907; PIDN:CAA63900.1; PID:e222100; PID:g169
C;Comment: This protein is involved in an intercellular signalling system.
C;Genetics: A;Gene: SpaA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ricole, S.T.; Brosch, R.; Parkhill, J.; Garnier, T.; Churcher, C.; Harris, D.; Gordon; Connor, R.; Davies, R.; Devlin, K.; Feltwell, T.; Gentles, S.; Hamlin, N.; Holroyd, Rajandream, M.J.; Rogers, J.; Rutter, S.; Seeger, K.; Skelton, S.; Squares, S. A. Description: Lipo-Oligosaccharide Nod-factor signals permit rhizobial penetration into A: Reference number: S34303

A. Accession: S34305

A. Accession: S34305

A. Accession: S34305

A. Reference number: BNBL:X73362; NID:g312347; PIDN:CAAS1774.1; PlD:g312350

C. Comment: This is one of the proteins, coded by nodulation genes, that are required for A: Genetics:
